Going with and "forking" VUFind

August 19, 2009

Note: This is the second in a series I'm doing about our VUFind installation, [Mirlyn](#). Here I talk about how we got to where we are. Next I'll start looking at specific technologies, how we solved various problems, and generally more nerd-centered stuff.

When the [University Library](#) decided to go down the path of an open-source, solr-based OPAC, there were (and are, I guess) two big players: [VUFind](#) and [Blacklight](#).

I wasn't involved in the decision, but it must have seemed like a no-brainer. VUFind was in production (at [Villanova](#)), seemed to be building a community of similar institutions around it (e.g., Stanford), and was based on a technology stack we had some experience with (PHP). Blacklight seemed to be just getting off to a fitful start, and its Ruby stack was at that time an iffy proposition (this was before any sort of major adoption of [Passenger](#) or [JRuby](#)).

As I write this, things have flipped around a little. Andrew Nagy, the principle architect of VUFind, left Villanova for Serial Solutions and VUFind stopped being his primary focus. The Blacklight community decided to go with a major reorganization of the code to make it easier to deploy, which resulted in a flurry of refactoring and improvements and folks generally thinking things through really well. Stanford just flipped the switch from their VUFind to a Blacklight installation, and as I pointed out, the Ruby

I think we have taken the same road with our "Suchkiste" project based on VuFind. VuFind was a convenient user interface for our Solr index that we could deploy quickly to have some kind of prototype interface to show our ideas (the Solr XML interface is not that sexy in public demonstrations :-). And I think we experienced similar disappointment with the state of the VuFind community and so decided to do our own thing as well. Today I think, that is wrong. It just doesn't make sense, that we all redundantly fix the same issues in our VuFind based projects (and there is still a lot to fix). And I think, it is a good idea to commit new features and improvements back to the main trunk to ensure their sustainability. You are right, that did not work in the past. But on the other hand: We can't complain about a missing community around VuFind. We are the ones that form (or not) that community. Of course you need to put some efforts into engagement in a community, but I think that pays off by what you may get back. And I feel, just at the moment there is a chance to make VuFind a real community project. But that depends on us individuals.

Community!
